## 01. Intro

We have carried out an analysis of the context in planning and physical terms, together with an evaluation of the site and brief. The proposal is established by setting design principles that respond to the immediate site context and developing these through massing and functionality studies into an emerging design concept.

### Brief

The site is located in Ljubljana Brdo and is approximately 13,800sqm in size. The brief calls for an educational building providing circa 8,000sqm of Laboratory space, Library space, Auditoriums, ancillary 'break-out' space, and Underground car parking. The anticipated construction budget (G0) is circa 48,250,000 Euros.

### Scheme summary

The proposal can be described as a 5 story (6+4) educational building measuring 29,772 m<sup>2</sup> gross external area including the basement.

The site measures 13,787 m<sup>2</sup> of which 5,872 m<sup>2</sup> will be covered by above-ground facilities and circa 7,500 m<sup>2</sup> below ground.

Proposed car parking provision is for 210 cars considering 50 spaces can be accommodated in the future car deck in the Campus' vicinity. There are 10 visitor car parking spaces provided along the road.

There is in total of 270 cycle parking spaces on-site and one dedicated delivery bay.

### Vision

Our aim for a new Faculty of Pharmacy building is to provide a space that is attractive, green, highly flexible/adaptable, future proof and fosters collaboration and innovation.

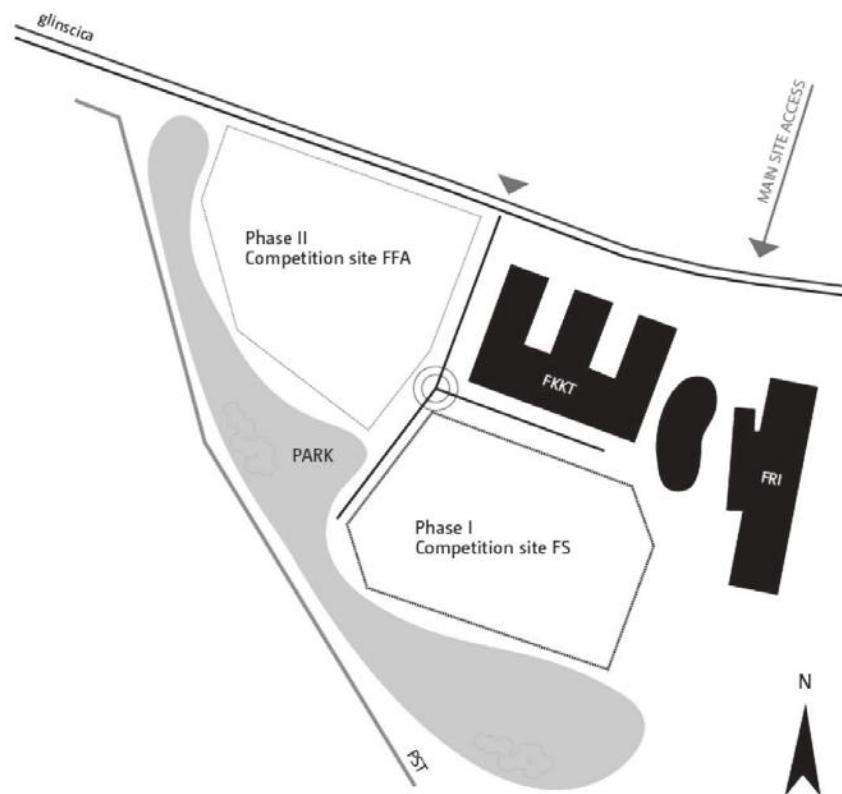

A place that will become a hub for students, researchers as well as for corporate partners and entrepreneurs in the Science sector.

## 02. Masterplan

### Design approach

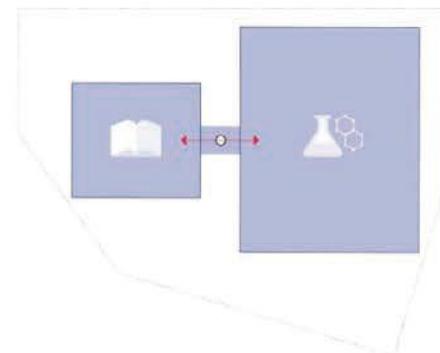

#### Key points

- Creating a new central place of the Future Science Campus
- Respecting the surrounding building heights and masses
- High-quality design and detailing to conserve and enhance the visual appearance of the Science Campus
- Respecting the surrounding greenery, with views to the north, south, and west
- Apply consistent external works and landscaping philosophy that will improve the public realm and campus for its occupants and visitors
- The proposal considers anticipated access points
- Inclusion of heavy laboratory space
- A flexible building that will allow for future adaptability of laboratory space
- Support a sense of community
- Maximising open green spaces

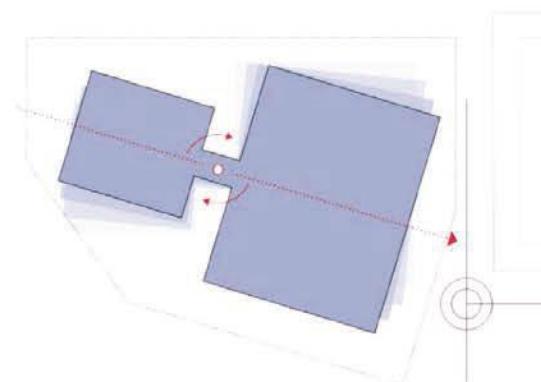

## 03 Architecture

### >> Masterplan Diagrams

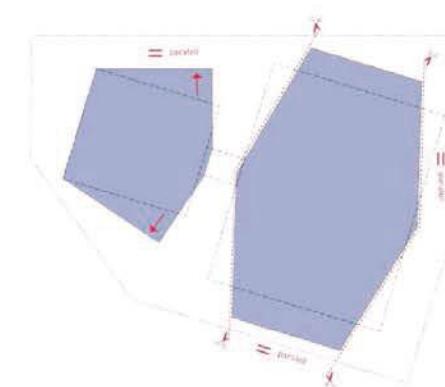

TWO VOLUMES

We have divided the program of Faculty of Pharmacy into two main parts; each part has its own building that is connected via bridges on every level. The laboratories are housed in the bigger volume while teaching and common spaces in the smaller volume.

ROTATION

The new master plan signals a new focal point located between the Faculties of Chemistry, Pharmacy, and Mechanical Engineering. The building volume is tilted toward the focal point to create a central entry space to the new University Campus.

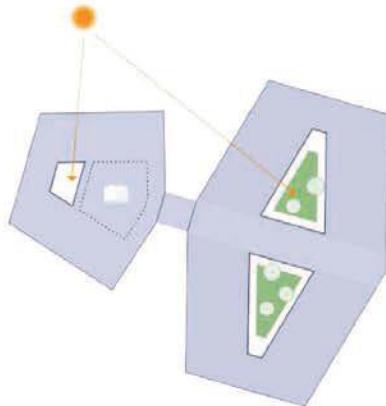

SITE ADAPTATION

The building blocks are refined by trimming the edges to align with the site boundary and the surrounding building. With mirroring, a hexagon-shaped building is created that amplifies dynamics of external and internal spaces.

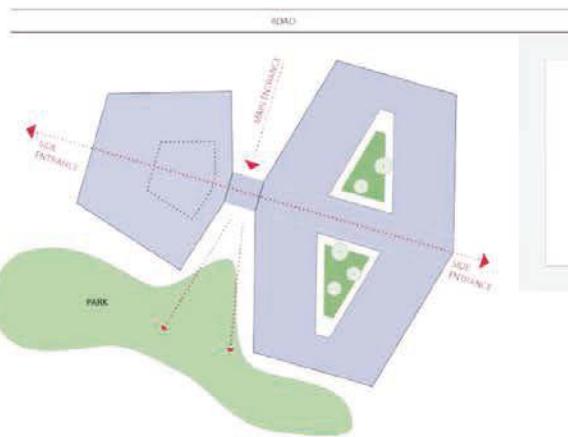

## 03 Architecture

### >> Concept Diagrams

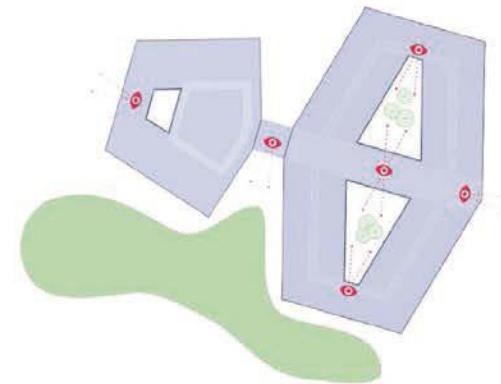

'atriums'

Two large atriums are introduced to provide ample daylight to the teaching and laboratory spaces. Following the biophilic design principles, the four-story atriums are filled with lush plant life increasing the student/teacher connectivity with natural environments, promoting health and wellbeing.

MAIN ENTRANCE

The arrival space between the two volumes forms an impressive entrance area to the north and to the south creating a strong visual connection with the park. The building is designed to have two frontages - the 'road' frontage and the 'park' frontage. Side entrance/exit points are located at the end of the main 'axis' of the building running east-west.

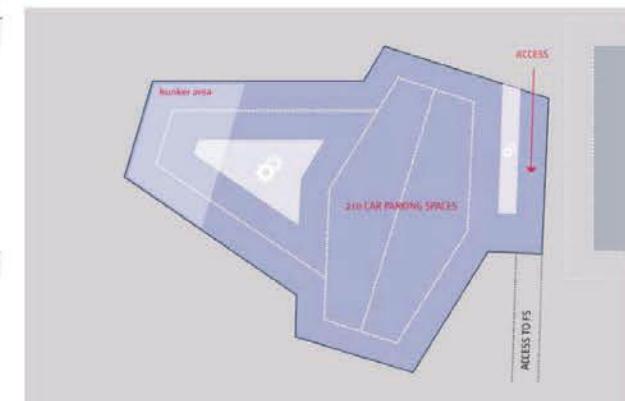

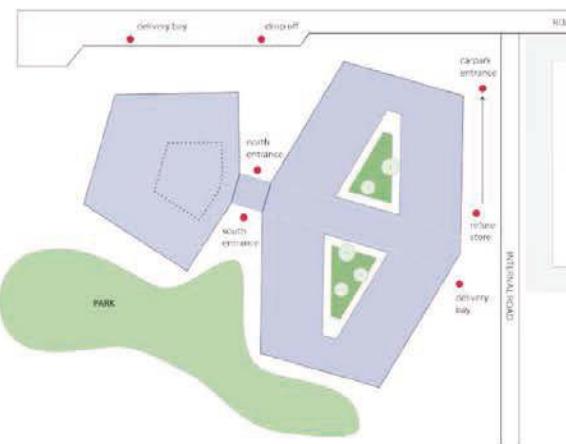

VIEWS OUT

The building is designed to promote 'green' and features a diversity of green spaces namely the natural green surroundings, the park with a water feature to the south and lush green atriums. By exposing views to greenery from every room the quality of learning environments for student and teachers will be enhanced.

## 03 Architecture

### >> Concept Diagrams

#### VERTICAL COMMUNICATION

The lab building is serviced by a central core and two satellite stair cores on each side. The core contains three lifts, fire escape stair and washroom area with 'superloops' - space-saving all-in-one unisex units that can be split among students and teachers while still maintaining the privacy.

The non-laboratory building is serviced by a compact central core with two lifts and two stairs. An additional fire escape stair is provided on the other side of the building.

#### CIRCULATION

One of the key drivers of our design is to promote the interaction between students, researchers and teaching staff. The main horizontal communication link is running east-west connecting laboratories and non-laboratory teaching spaces through a series of break out spaces fostering collaboration and discussion.

#### VEHICULAR ACCESS / SERVICE ROUTES

The vehicle site access is from the north through Vecna pot where a turning bay is provided at the end of this road. A two-way service road runs along the eastern site edge. Visitor car parking area is provided to the northern part of the plot in vicinity to the drop-off area.

A footpath is provided around the building perimeter to give full access for cleaning.

#### REFUSE

It is anticipated that several service vehicles will access the site via the service road on the eastern side. The refuse store is located next to the ramp and close to the east side entrance of the lab building.

#### BASEMENT ARRANGEMENT

Underground level measures 7642 m<sup>2</sup> in total and will provide 210 car parking spaces. The carpark number considers 50 spaces that can be accommodated in the future car deck in the Campus vicinity. The basement will also accommodate heavy plant equipment such as compressors, watertanks, central heat generators, etc.

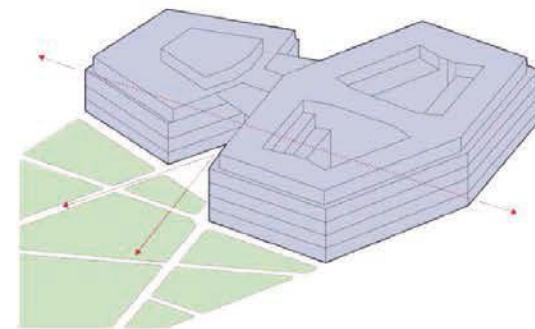

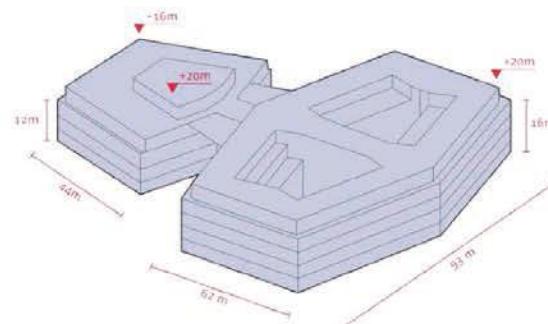

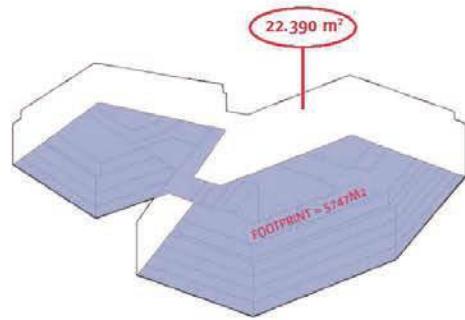

As per the brief, the ramp to the underground car park is as located on the eastern side of the building next to the Faculty for Chemistry and is accessed from the north via the Vecna pot.

#### BUNKER

The west side of the basement is a dual purpose. Over 1,000 m<sup>2</sup> is allocated to the bunker area. Structure design, washroom facilities, additional means of escape are subject to later stages of the design.

## 03 Architecture

>> Key data

### BUILDING AREA AND FOOTPRINT

The proposed main building will deliver 22,190m<sup>2</sup> of gross area (29,772 m<sup>2</sup> including the basement) over 5 levels with a footprint of 5,872 m<sup>2</sup>.

### BUILDING DIMENSIONS

Number of above ground facilities: 2  
Number of floors: Basement + Ground + 3 Level + set back Floor (Terrace Level)  
Relative height: +20 m

Building dimensions (both buildings): 115 m x 90 m  
West building dimension: 44 m x 55 m  
East building dimensions: 63 m x 52 m

The floor to floor height is set at 4 meters for all the floors apart from the ground floor level of the Laboratory building where Laboratories require walk on ceilings.

A cantilevered canopy with metal louvers visually connects the two buildings covering the entrance area on both sides and providing a sheltered external area for its occupants.

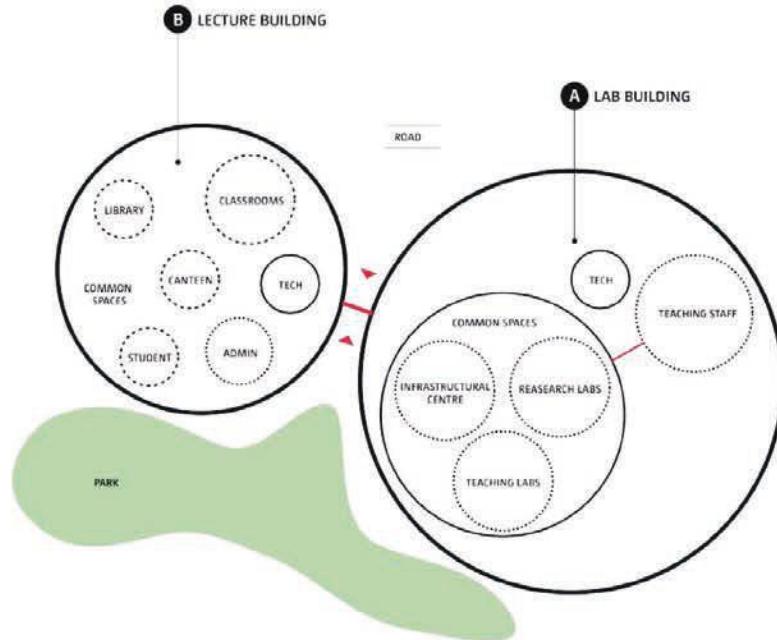

### LANDSCAPE

Surrounded by natural heritage on three sides, the building is designed to maximise open green spaces. Two volumes are lightly linked by the glazed bridge lets the greenery pass through the site north-south.

Open green areas to the south shall be designed as a merger of the Campus common and the public park providing an attractive outdoor amenity for students, visitors, and the local community.

## 03 Architecture

### >> Internal Arrangement

**Building A**

With a focus on adaptability and cross-collaboration, all lab facilities are accommodated inside a single volume allowing for various mixtures of Science clusters which also enables different departments to either expand or contract in the future. One department includes a set of research and pedagogical labs. The building is designed in the way that research labs can be located on the northern side or on the inner perimeter overlooking the green atriums. The ground floor level has an increased floor to ceiling height and is sunken for 1 m to accommodate 5 m labs with walk-on ceilings.

Teaching staff offices are located on the top two levels connected with the labs on lower floors via lift/stair cores.

The majority of the plant is placed on the rooftop areas and the basement. Offices and depots are on the ground floor apart from IT and building manager which are located on the upper levels in the vicinity to the vertical cores.

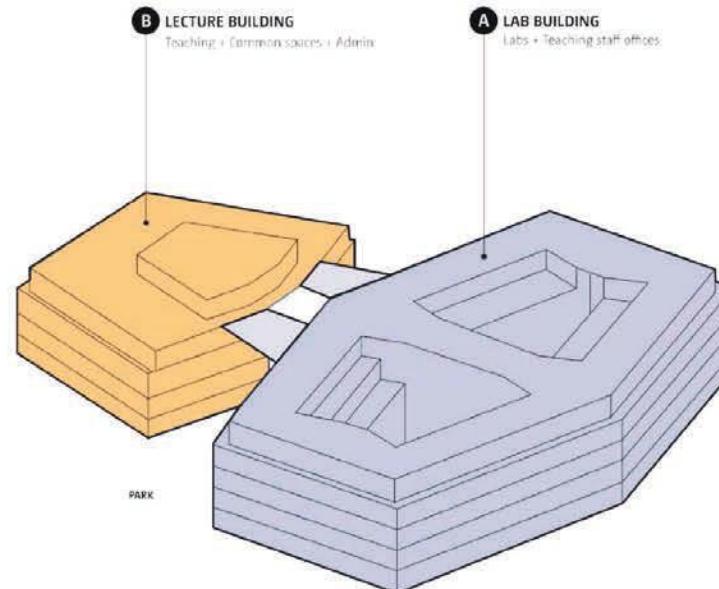

**Building B**

Building B acts as an independent volume accommodating all teaching and common spaces, linked to the main laboratory building via the bridge.

Two large lecture theatres, each a double-height volume, are set one on top of the other in the centre of the building. The circulation is placed around the large volume on every level creating a comfortable connection to the surrounding spaces. All lecture rooms are arranged on level 3 around the external perimeter.

The administration is independent and organised on the first level. Student service office and the room for dissertations serves as a separate administrative unit connected with the student communal facilities on the ground floor level. The student canteen and central social space have direct access to outdoor 'break out' space on the western side.

The library is placed on the top set back floor enjoying green terraces with views to all directions.

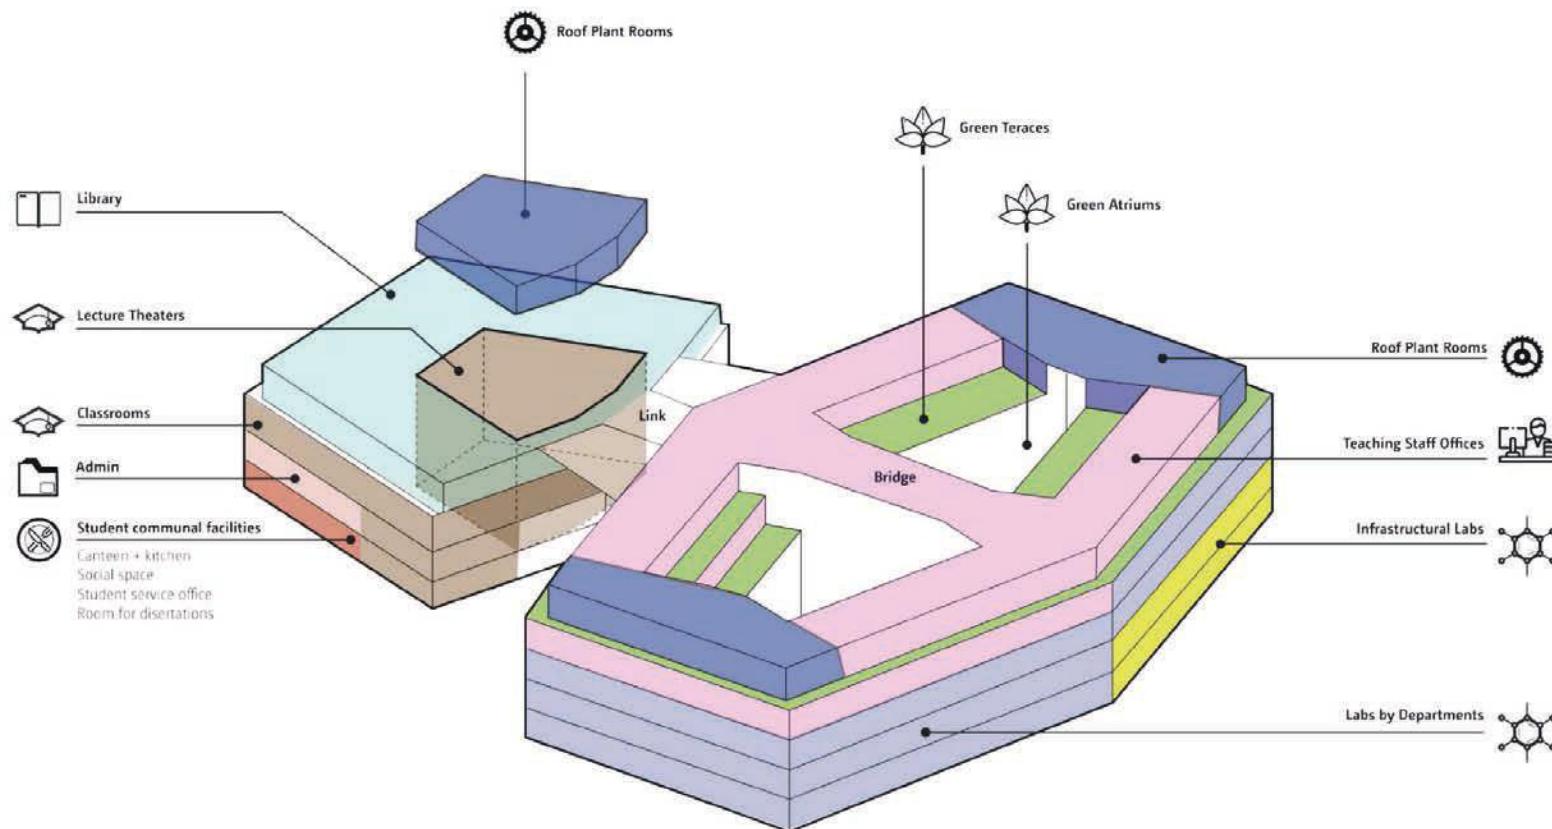

**Building security and operation**

In relation to building security, sophisticated and effective electronic systems will deliver the required level of security on the premises. Having a separate access control system for each building means they can be operated individually. While the lab building will require more strict secure access, the lecture building can be open later in the evening to allow students the use of the library, quiet learning spaces, and spaces for collaboration. This solution can also accommodate sublets to other organizations, or various events/conferences during weekends and summer breaks.

## 03 Architecture

### >> Internal Arrangement

## 03 Architecture

### >> Typical Lab Floor

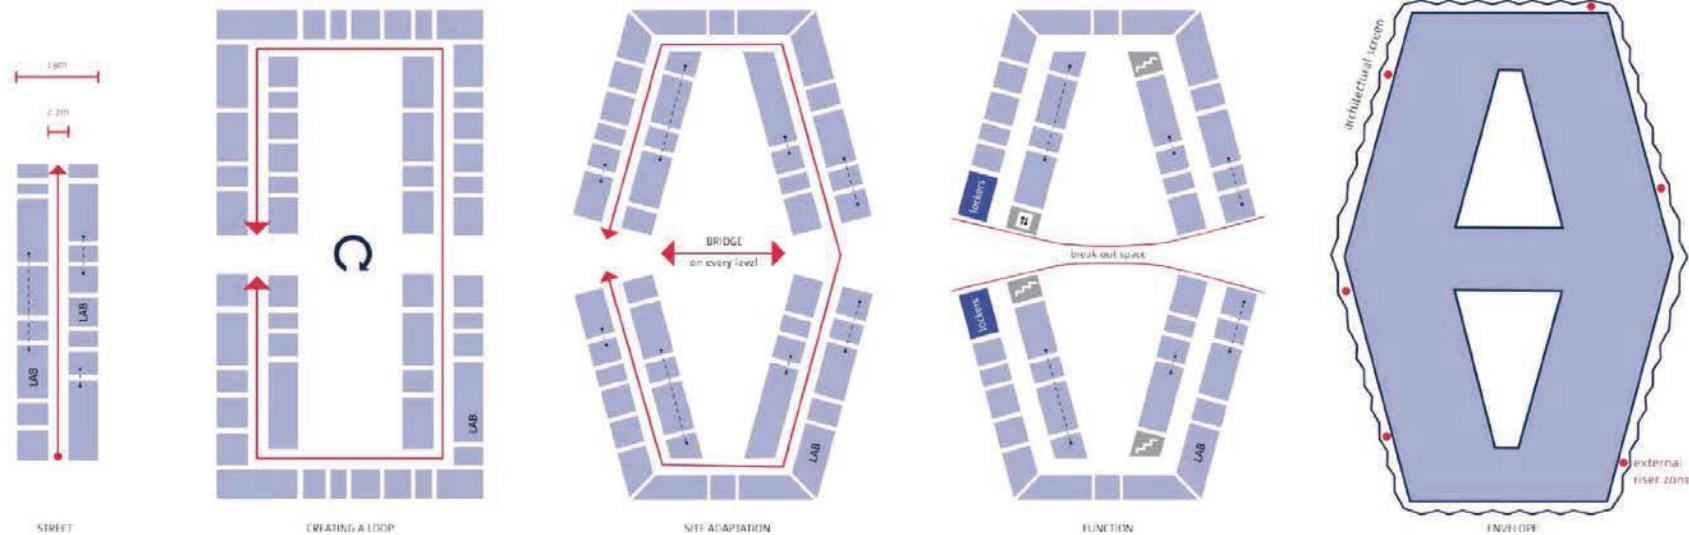

Internally, each building wing is 19m wide providing high-quality laboratory accommodation. The structural solution is based on 8.1m x 8.1m grid. All structural walls, providing lateral stability, are in the façade zone allowing for highly adaptable laboratory spaces with easy access for servicing.

The building layout comprises an internal loop with corridors to avoid dead-end conditions or sleeping corridors. A 2.2 m wide corridor runs around the building centre providing access to laboratories on both sides.

Floors are connected via lift cores and stair cores evenly spread out to provide safe evacuation for its occupants. A wide bridge separates the building in the middle of every level offering a series of 'break-out' spaces. It creates a vertical social hub increasing the opportunity for social interaction, collaboration, and relaxation with views to the lush green atriums on both sides.

There are five locker areas in the building - one for each academic year. These are located next to the washrooms and the main lift core on all lab floors.

For future adaptability , or altered internal layouts for laboratory spaces, the layered facade system allows for any additional future extract ductwork to be located externally behind the architectural screen.

## 03 Architecture

### >> Facade design

The design of the external envelope is of paramount importance in order to make sure that the proposal will have a positive impact on its surrounding, provide thermal comfort and have sufficient daylight.

At this stage we anticipate the laboratory building façade as a standard blockwork with insulated render finish, screened with architectural louvre system. The aluminium window system would be inserted above the parapet level of 900mm. The brise soleil system is held away from the façade line allowing for a 500mm space in between for any external extract ductwork which would be serviced through the catwalk on every level. Moving these extracts outside of the building enables greater flexibility for the operator to reconfigure internal laboratory spaces in the future. Penetrations at ceiling level can also be made at any location without affecting the aesthetic appearance of the building.

The proposed custom made timber brise soleil system consists of vertical timber slats, each spanning over one level. The system overlays the building's volume and acts as a curtain unifying the architectural form of the building whilst protecting the building of unwanted solar gains as well as covering any future extract ductwork.

The lecture building façade build-up is also standard blockwork with insulated render finish. To contrast the timber cladded lab building, the facade is screened with architectural louvre system that consists of vertical white translucent glass or polycarbonate elements attached to the steel substructure.

#### 1. Laboratory building facade

- Blockwork walls with insulated render system
- Aluminium window system, parapet 900mm
- Glazed timber doors, motorised where required
- An integrated, electromechanically operated, revolving door system
- Architectural screen: Vertical timber elements attached to the steel structure; 500mm catwalk behind the louvre system for cleaning and maintenance

#### 2. Curtain walling

#### 3. Atrium facade

- Blockwork walls with insulated render system
- Aluminium window system, parapet 900mm
- Curtain walling to central spaces (bridge)

#### 4. Green terraces

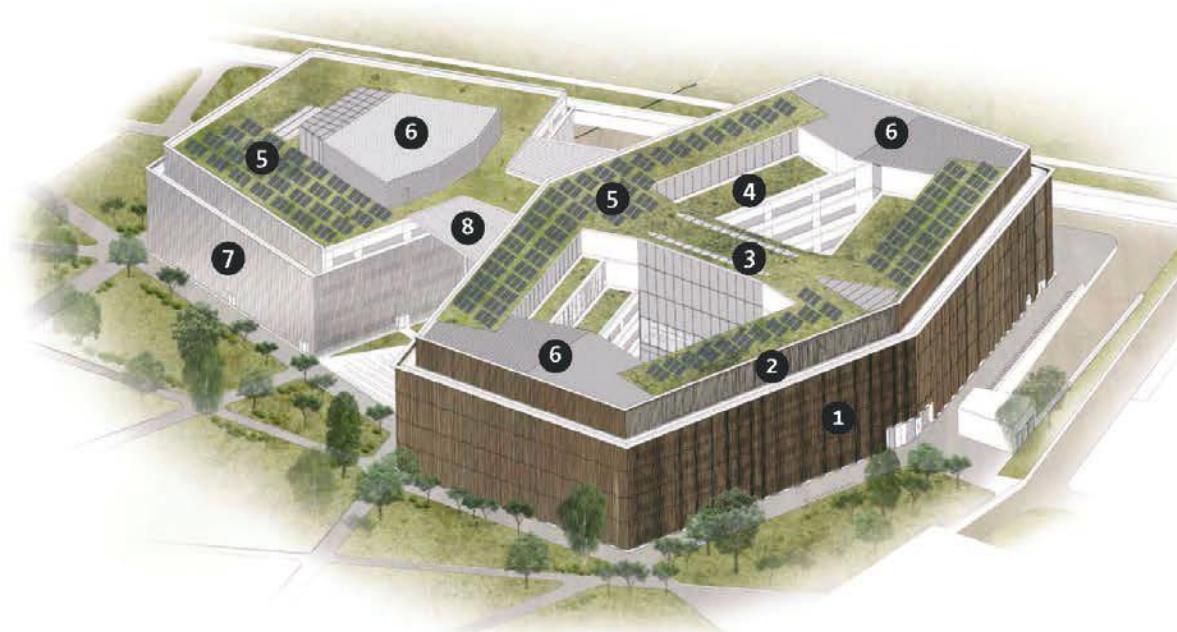

#### 5. Green roof

#### 6. Open plant room spaces

#### 7. Lecture Building facade

- Blockwork walls with insulated render system
- Aluminium window system
- Glazed timber doors, motorised where required
- Architectural screen - Vertical translucent glass or polycarbonate elements attached to the steel sub structure, 500mm catwalk behind the louvre brise soleil system for cleaning and maintenance

#### 8. Steel canopy structure with aluminium louvers

## 03 Architecture

### >> MEP Strategy

#### THERMAL COMFORT

The laboratory spaces will be mechanically ventilated to maintain suitable environments for the science being undertaken in them, particularly in relation temperature, humidity, cleanliness of incoming air and the ability to maintain an appropriate pressure regime / air flow cascade.

Other spaces in the building that have an adjacency with the façade will be assessed for their viability to be provided with natural ventilation as the primary means of providing sufficient fresh air to the occupants. Such spaces include the write-up and office accommodation.

When considering the feasibility for natural ventilation, or utilisation of natural ventilation in a mixed mode ventilation scenario, the following key considerations will be addressed:

- Energy efficiency of solutions
- Acoustic impacts of opening façade
- Air quality
- User comfort and expectations

#### MECHANICAL DESIGN AND DISTRIBUTION OF SERVICES

The general principle for mechanical plant is that wet, heavy services are located in the basement areas.

- a compressor station for the preparation and distribution of compressed air
- boiler room
- space with heat station for the preparation of cooling and heating medium
- sprinkler engine room
- water tanks

Air handling plant and heat rejection plant is at roof level. Some air handling plant will be located in the building for the specialist laboratories provided with interstitial floors. All services are distributed through the building via a series of dedicated risers positioned around the cores. Where possible, all risers are dedicated or similar services (i.e. vent located in one riser, all cold wet services in another riser, and hot services in another).

At each floor plate, the services exit the risers, with appropriate fire protection. Services shall generally distribute within corridor ceiling voids, rather than directly over occupied spaces. Branches shall then be taken into occupied spaces, where they shall distribute further.

Points of isolation shall be provided at the point of exit from risers, and for each individual room served, to allow services to be readily isolated and modified without affecting other areas of the building.

Where laboratories are provided with an interstitial floor void ductwork and associated ancillaries (control dampers, HEPA filters, heater batteries, gas tight dampers etc.) are all to be contained within this void, to allow for ease of maintenance.

#### ELECTRICAL INSTALLATION AND EQUIPMENT

##### **Lighting**

The building will be designed to maximise natural daylight where possible. The building has been designed with 'courtyards' to limit the depth of the building and to offer more accommodation on the buildings perimeter. This in turn will improve daylighting.

##### **Artificial lighting**

Lighting systems throughout the building will be designed to achieve the following objectives:

##### **Safety and Security**

The lighting installation will provide a safe means for building occupants to move around the floor under normal conditions and escape from the building in emergency conditions.

##### **Lighting Levels**

The Illuminance levels in the main laboratories, collaboration areas, offices etc and will be designed to meet the demands of the task and function of the lit spaces.

##### **Visual Environment**

The lighting design will enhance the form of the building, provide interest and assist in the movement of the building users whilst integrating with the architectural vision for the floor.

##### **Energy Efficiency**

The lighting installation will be designed to minimise energy consumption whilst fulfilling the lighting levels criteria. This will be achieved by the choice of LED luminaires. In addition, intelligent lighting controls will be provided in the form of occupancy sensing and individual control. Luminaires in areas of the building which have enough daylight penetration will be controlled via daylight sensors. The artificial lighting levels will be reduced when daylight is available. The luminaire control will dim or raise the output of the luminaire as the level of available daylight varies rather than switch the luminaires on or off. Gradually raising the level of artificial lighting as the available level of daylight reduces provides a steadier level of lighting for building users rather than simply turning lights off once a daylight threshold has been reached.

##### **Intelligent buildings**

This project presents an interesting opportunity to consider digital transformation for an Intelligent Building (IB). A common digital platform can realise enhanced user experience, enhanced facilities management, and offer a rich data to enable analysis of building performance.

For this project we would consider a Converged Network System. This would provide connectivity between a number of systems and services. This would include all the buildings systems such as BMS, Lighting, fire alarm and energy management. Also connected to this system could be a number of features designed to enhance the user experience such as workplace utilisation, event scheduling, parking and so on.

#### METERING

A comprehensive metering system monitoring electricity, water and HVAC energy use will be installed. The metering system will be installed so that data collection occurs automatically from every metered point.

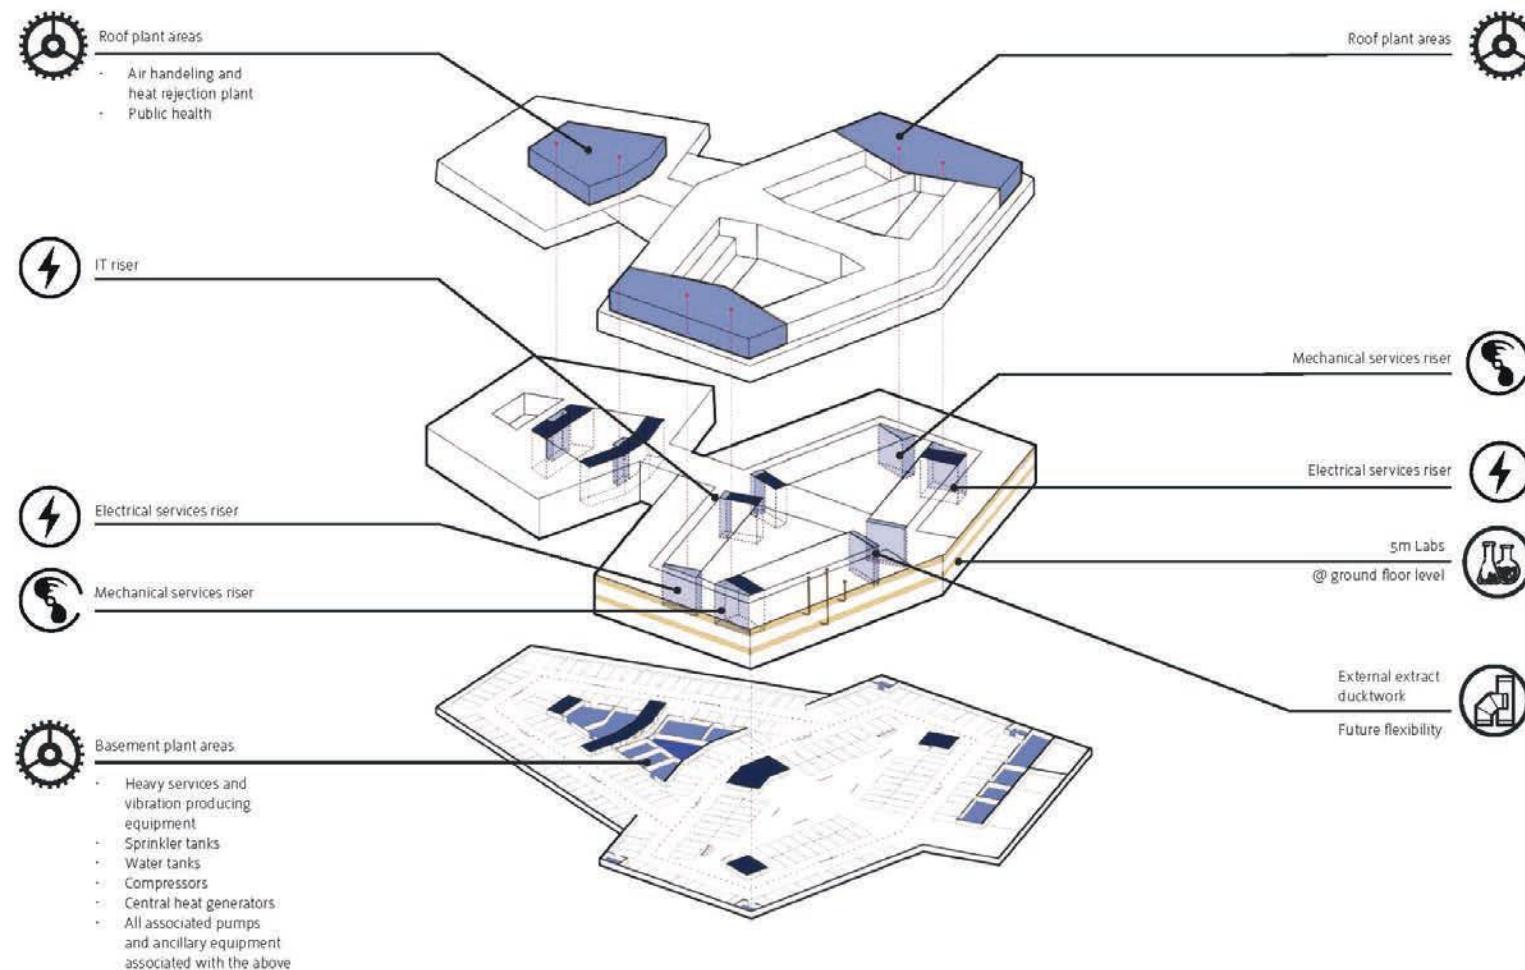

Data from the metering system should be combined with operational data from the BMS to allow analysis of building operation. This would then allow the performance of the building and its subsystems to be assessed and improved. Real time and recent historical trends (typically over 10 days) and information graphics could be made available to the building users and facility management teams. This information allows the FM teams to act to improve building operation and should also be used to drive behaviour change by the building users to reduce energy consumption.

##### **Electrical diversity**

It is understood that all the laboratories can operate simultaneously but clearly not all loads will occur simultaneously. We could apply diversity as suggested below:

## 03 Architecture

### >> MEP Strategy

## 03 Architecture

### >> Structural Design

**Vrsta objekta:** Monolitna armiranobetonska konstrukcija

**Tip temeljenja:** Globoko, na uvrtnih AB pilotih  $d = 120$  cm

**Statični sistem objekta:** Mešani sistem (stebri/stene)

#### ZASNOVA KONSTRUKCIJE

Nosilna konstrukcija objekta bo armiranobetonska, globoko temeljena na uvrtnih pilotih. Predviden premer pilotov je  $d = 120$  cm. Dolžina pilotov bo cca  $l = 20.0$  m. Zaradi zahtevnih geoloških in hidrogeoloških razmer v tleh, bo končna dimenzija, dolžina in nosilnost pilotov določena v nadaljnjih fazah projektiranja.

Nad glavami pilotov tečejo pilotne grede dimenzij  $b/h = 140/140$  cm (višina skupaj s ploščo). Med gredami se zaradi visokega hidrostatskega pritiska predvidi talna plošča debeline  $d = 35$  cm. Celotno klet objekta bo potreben izvesti kot vodo neprepustni keson po principu bele kadi.

Vzhodni in zahodni del objekta sta med seboj dilatirana. Povezava med obema objektoma je predvidena z jekleno povezovalno konstrukcijo, pri kateri so predvideni takšni spoji, da omogočajo pomike. Dilatačni enoti v podzemnem delu sta med seboj povezani z dilatacijskimi profili oz. tesnilnimi trakovi, ki morajo ob ustrezni vgradnji in vzdrževanju zagotavljati vodotesnost in trajnost objekta.

Nosilni sistem kleti predstavljajo AB stebri dimenzije  $b/h = 50/120$  cm,  $b/h = 50/80$  cm in  $b/h = 50/40$  cm ter nosilne AB stene, debeline 25 cm. Zasute stene so debeline  $d = 30$  cm.

V področju zaklonišča so zunanjne stene in plošča nad kletjo debeline 50.0 cm.

V horizontalni ravni zadostno togost konstrukcije zagotavljajo AB plošče. Plošča nad kletjo je debeline  $d = 28$  cm. – 35 cm. Zasuti del plošče nad kletjo je debeline  $d = 40$  cm.

Plošča je pohodna z upoštevanjem koristne obtežbe 5 kN/m<sup>2</sup> (zbiranje ljudi) in obtežbe nasutja višine skladno s predvideno sestavo tlakov.

Etažne plošče so debeline  $d = 28$  cm. – 32 cm. Za prevzem višje prebojne sile se pod kritičnimi točkami ab plošče umestijo vute.

#### MATERIJALI

Uporabiti je potrebno ustrezne materiale:

Beton (v skladu s SIST EN 206:2013, SIST EN 1026:2016, SIST EN 13670:2010/A101:2010)

Konstrukcijsko jeklo za armiranje material B 500B J2 po SIST EN 10025, SIST EN 10210 in SIST EN 102

#### OBTEŽBE

##### > Osnovne obtežbe

Stalni vplivi (lastna teža elementov nosilne konstrukcije in dodatna stalna obtežba) predstavljajo vertikalno obtežbo na konstrukcijo. Dodatno je upoštevan zemeljski pritisk in hidrostatski pritisk. Spremenljivi vplivi (vertikalni in horizontalni), ki delujejo na objekt so:

- vplivi koristnih obtežb za kategorije:  
C<sub>2</sub> – površine s pritrjenimi sedeži,  
C<sub>3</sub> – površine v javnih in upravnih stavbah  
C<sub>5</sub> – površine na katerih lahko pride do gnečev (površine kjer se zbirajo ljudje),  
E<sub>1</sub> – površine, kjer je možno kopčiti blago,  
F – prometne in parkirne površine za lahka vozila,  
H – strehe, dostopne le za normalno vzdrževanje in popravila.  
-
- vplivi snega za področje Ljubljane
- vplivi vetra za področje Ljubljane

##### > Izredna obtežba

##### Potresna obtežba

Izredno obtežje predstavlja potres. Objekt je po pregledni karti ARSO lociran v potresni coni s projektnim pospeškom temeljnih tal  $a_g = 0.25 \times g$ . Konstrukcija je analizirana v pogojih vzbujanja s seizmičnimi pospeški. Faktor pomembnosti objekta je 1.0. V analizi je upoštevan tip tal C.

##### Intervencijska pot

Intervencijska pot čez ploščo nad kletjo ni predvidena.

##### Zahteve za zaklonilnike

Upošteva se Pravilnik o tehničnih normativih za zaklonišča in zaklonilnike. 11. člen pravilnika narekuje: »Pri ostalih novograjenih objektih, pri katerih gradnja zaklonišč je obvezna, načrtovani pa so v območju naselij z obvezno gradnjo zaklonišč, je treba ojačati ploščo in elemente, ki podpirajo ploščo nad prvo etažo tako, da zdrži vplive rušenja objekta nanjo.«

Zagotoviti je potrebno dvema pogojema pravilnika, in sicer:

- (8. in 45. člen pravilnika) upoštevati je potrebno nadomestno vertikalno obtežbo ruševin:  $P = 10$  kN/m<sup>2</sup>, na vplivnem območju ruševin  $d = H/4$ ;  $H$  – višina objekta (merjeno od tal do spodnjega roba strehe)
- (40. in 127. člen pravilnika) konstrukcijsko je potrebno povezati predelne stene zaklonilnika z nosilnimi elementi tako, da lahko zdržijo obtežbe zaradi zračnega udara. Vpliv zračnega udara se nadomesti s statično obtežbo pravokotno na površine elementov konstrukcije zaklonišča in znaša:  $p = 30$  kPa.

## 03 Architecture

### >> Sustainability

#### SUSTAINABILITY AND ENERGY EFFICIENCY

The building will be designed with energy efficiency and reduction of carbon emissions as a priority. The design will adhere to the 'Rules on efficient use of energy in buildings' TSG-1- 004:2010. The strategy for the design of the building is to follow the Energy Hierarchy approach. This 'fabric first' approach aims to reduce energy demand in the first instance by passive design measures such as high fabric performance. Secondly, energy efficient systems will be used to further reduce the carbon emissions of the development. Finally, the integration of low and zero carbon energy sources will be considered in order to meet the carbon emission targets.

##### Fabric first

- Optimise the façade thermal performance – U and G values
- Solar shading
- Maximising opportunities for natural/mixed mode ventilation including utilising the buildings mass for night cooling
- Maximising daylight

##### Energy efficient systems

The following will be considered as the design progresses:

- High efficiency heat recovery on all mechanical ventilation systems
- Optimising ventilation and air change rates using demand control ventilation
- Low face velocity fume cupboards
- Automatic sash closing devices on fume cupboards
- High efficiency motors incorporated into all building services
- Collocation of all -80 freezer to a central space, so cooling can be delivered efficiently, and heat recovery incorporated.
- Provision of a lighting control system with daylight linking and occupancy sensing where appropriate to limit unnecessary use of electric lighting.
- Provision of a full building energy management system with energy metering to control and monitor all major energy consuming plant and systems.

##### Low and zero carbon energy sources

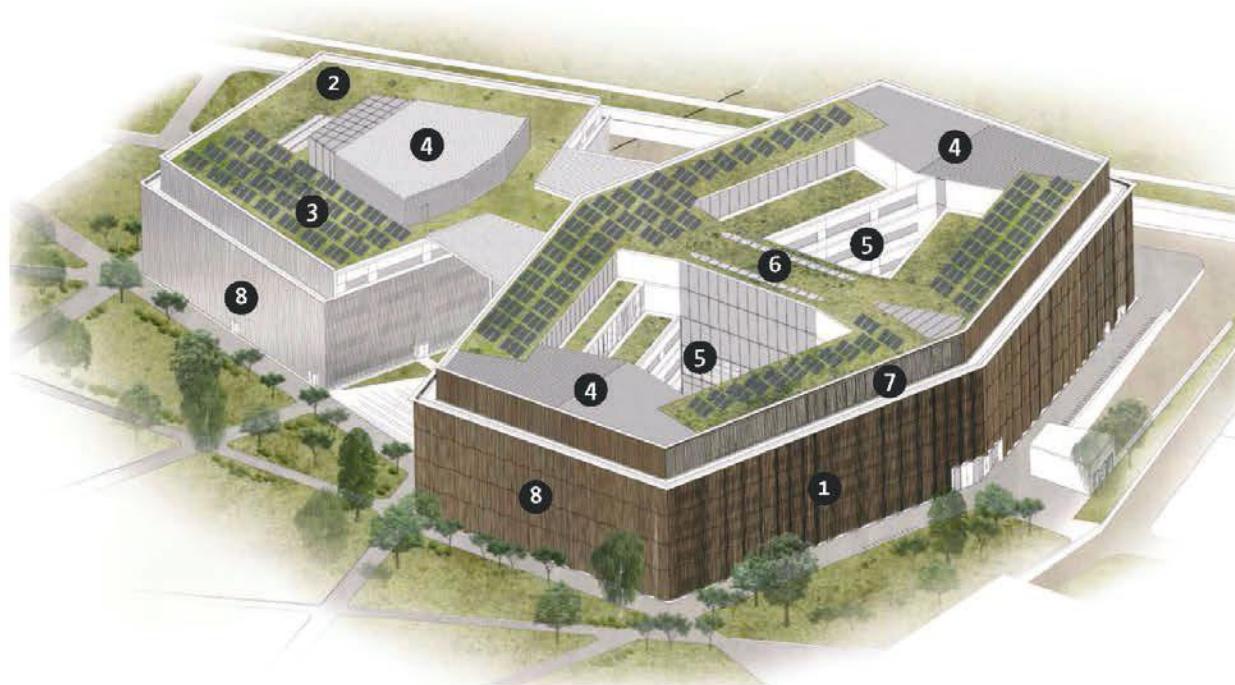

The following will be considered as the design progresses:

- Solar panels for hot water generation
- Photovoltaic panels
- Air source Heat pumps for heating and cooling

#### Key features

1. High performing building envelope
2. Rain water collection
3. Solar panels
4. High efficiency plant with heat recovery
5. 'Atriums' offer improved daylighting
6. Green roof to enhance biodiversity
7. Mixed mode ventilation in office areas utilising thermal mass
8. Façade screening to limit solar gains
9. Laboratories designed to reduce energy consumption

## 08. Contract Fees

### FFA:

Fee for architectural services for all stages including interior design and project management:  
**2,389,696 Eur** without VAT

(Note: no VAT for international architectural services)

### Uvoz v garažo:

Architectural services for all stages including interior design and project management:  
**85,560 Eur** without VAT

## 09. Investment evaluation

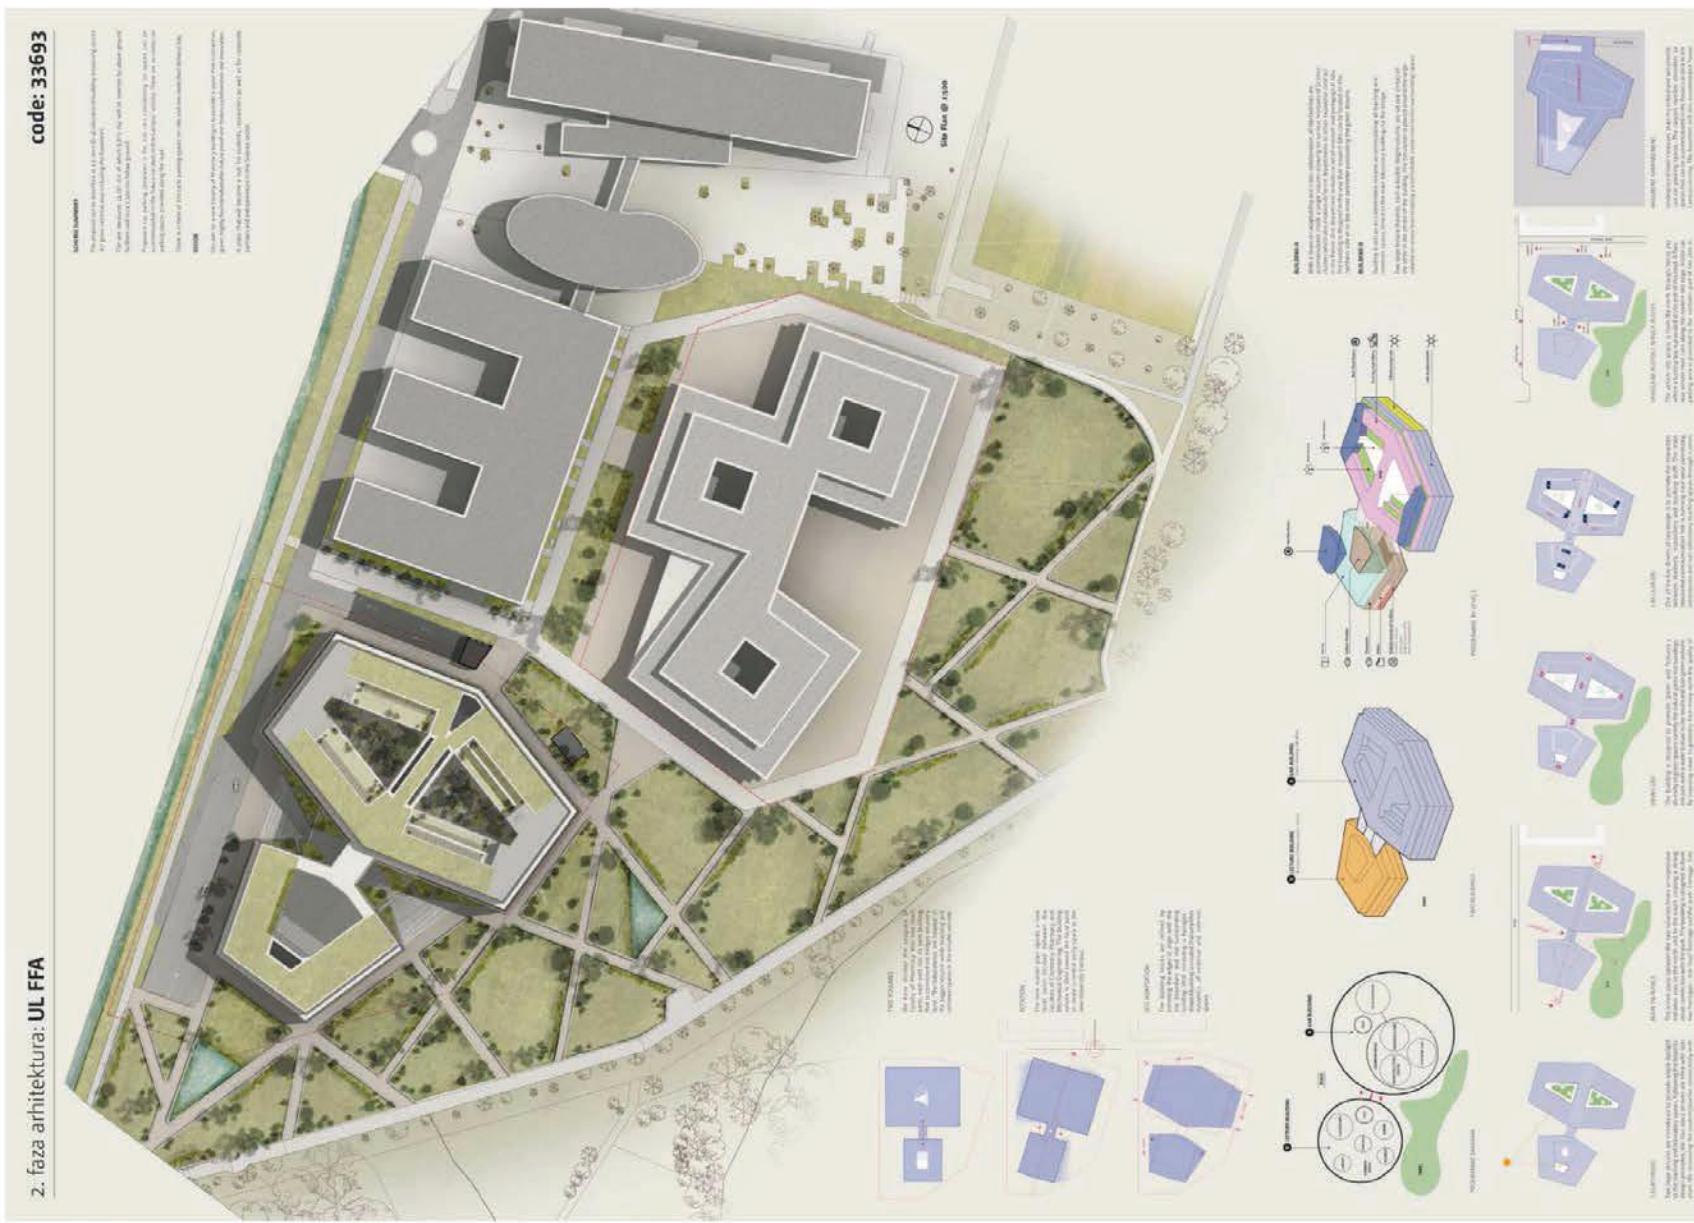

We have prepared the following preliminary estimate for the cost of the Building:

**47,972,000 Eur**

We would note that this cost is based on the following:

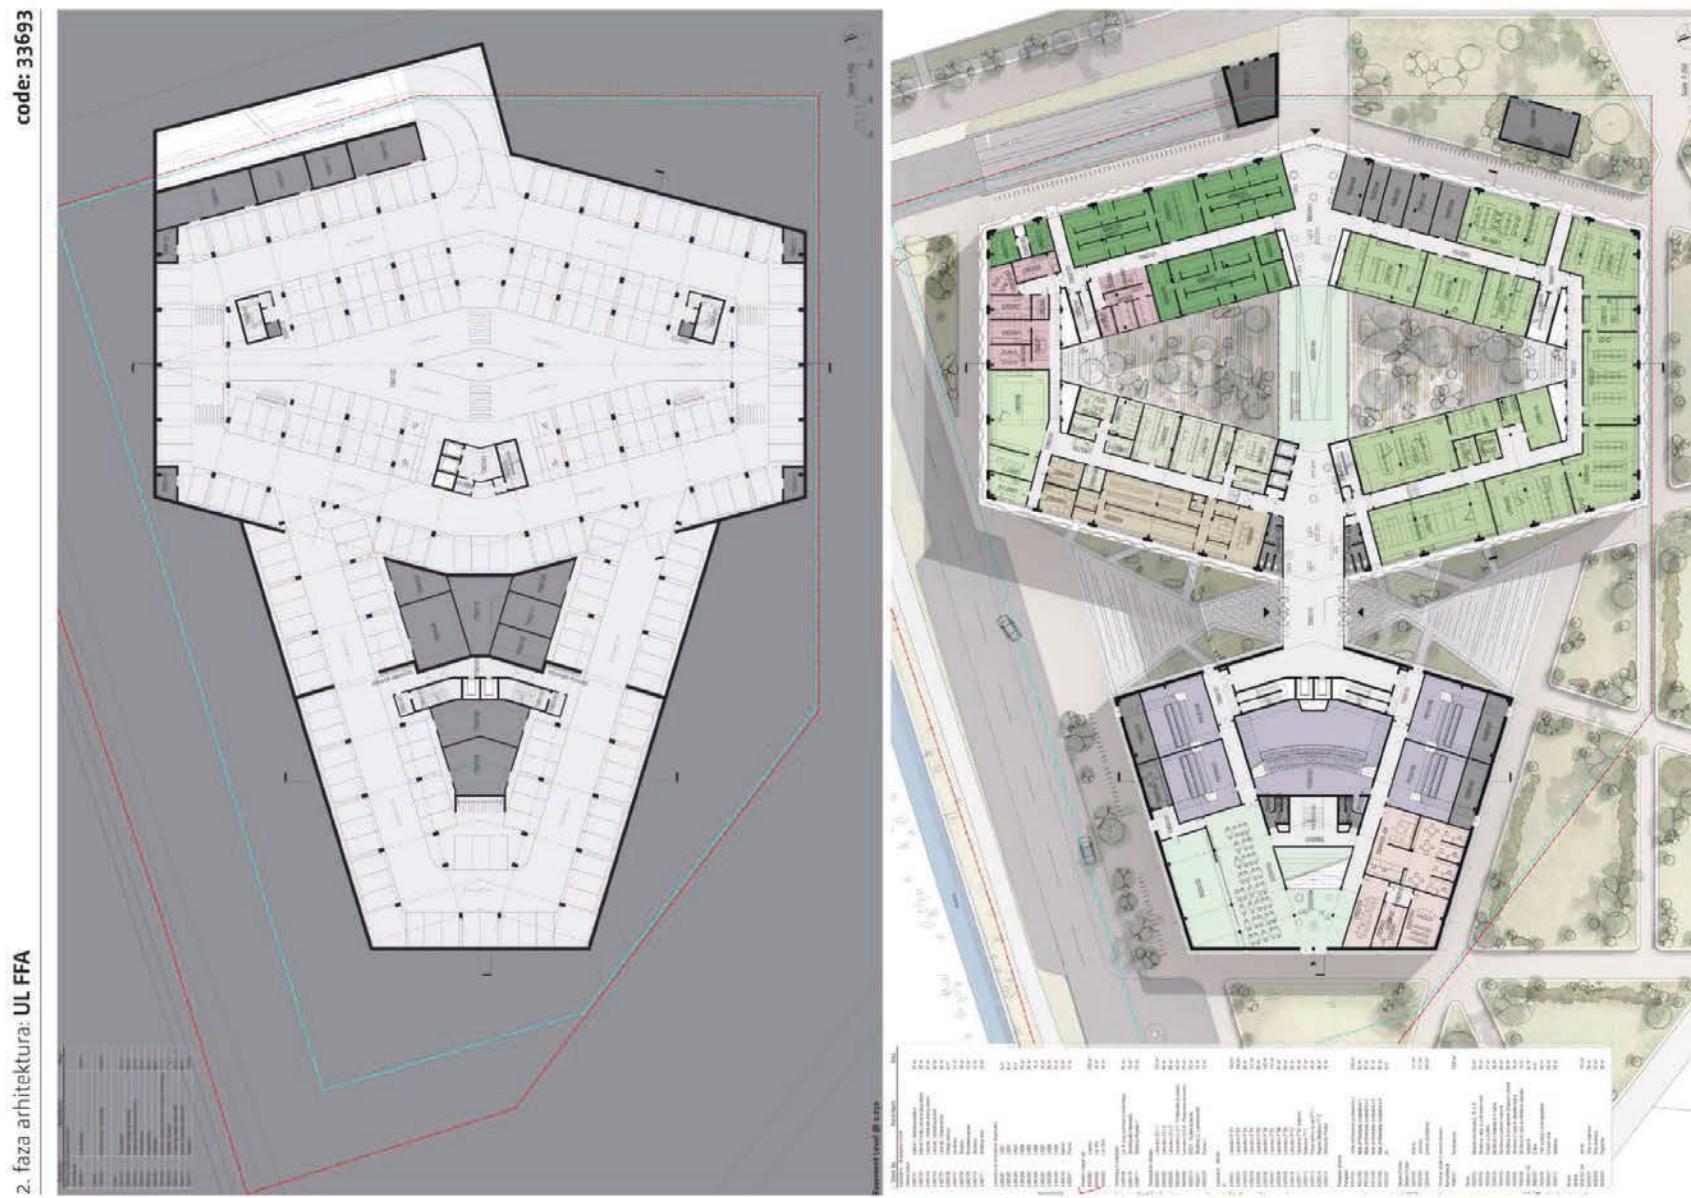

- Limited design information
- Costs are current Q3 2019;
- Excludes inflation, site acquisition costs, legal fees and external site works and utility connections;
- Includes an allowance of €2,000,000 for specialist equipment and other furniture, fittings and equipment.
